## AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings of claims in the application:

## LISTING OF CLAIMS:

- 1. (original) Method of making the execution of a computer program secure, the method being characterized in that it includes:
- a step of stacking a predetermined value in an instruction stack of the program; and
- a step of unstacking said stack adapted, where appropriate, to detect an execution anomaly.
- 2. (original) Method according to claim 1, characterized in that said stacking and unstacking steps are respectively associated with elements of at least one subset of instructions of said program.
- 3. (original) Method according to claim 2, characterized in that said elements are respectively an opening bracket and a closing bracket in a system of brackets.
- 4. (original) Method according to claim 2, characterized in that said unstacking step is associated with a return instruction of said program or a subroutine of said program.
- 5. (currently amended) Method according to any one of claims 1 to 4 claim 1, characterized in that said program is written in a programming language including a first instruction whose execution implements said stacking step and/or a second instruction whose execution implements said unstacking step.
- 6. (original) Method according to claim 5, characterized in that the second instruction terminates said program or a subroutine of said program.

- 7. (currently amended) Method according to any one of claims 1 to 6 claim 1, characterized in that said predetermined value is representative of a subset of critical instructions of said program.
- 8. (currently amended) A method according to any one of claims 1 to 7 claim 1, characterized in that it includes an anomaly processing step executed if, during said unstacking step, a value other than said predetermined value is unstacked.
- 9. (currently amended) Method according to any one of claims 1 to 8 claim 1, wherein said program includes at least one call to a subroutine, characterized in that said stacking step is effected before said call and said predetermined value is eliminated from said stack during execution of said subroutine.
- 10. (original) Method according to claim 9, characterized in that said predetermined value is the address of an anomaly processing function.
- 11. (currently amended) Method according to any one of elaims 1 to 8 claim 1, wherein said programming includes at least one call to a subroutine, characterized in that said stacking step is effected during execution of said subroutine and said predetermined value is eliminated from said stack after execution of said subroutine.
- 12. (original) Method according to claim 11, characterized in that said predetermined value is the address of an anomaly processing function.
- 13. (currently amended) Information medium readable by a computer system, and where appropriate totally or partially removable, in particular a CD-ROM, or a magnetic medium, such as a hard disk or diskette, or a transmissible medium such as an electrical or optical signal, characterized in that it includes instructions of a computer program for implementing a method according to any one of claims 1 to 12 claim 1 when that program is loaded into and executed by an electronic data processing system.

- 14. (currently amended) Computer program stored on an information medium, said program including instructions for executing a method according to any one of claims 1 to 12 claim 1 when that program is loaded into and executed by an electronic data processing system.
- 15. (currently amended) Electronic entity that has been made secure characterized in that it includes means for implementing a method according to any one of claims 1 to 12 claim 1.
- 16. (original) Electronic entity according to claim 15 characterized in that it is a smart card.
